

Aluminum Inswing Guide Channel Sill

The LaCantina Doors Aluminum inswing system with guide channel sill is an option for when interior and exterior floor levels are at the same level. Compared to our standard outswing sill there will be an approx. 5/16" gap between the bottom of the door panels and the floor. We recommend the guide channel sill for interior applications only and this option is not suitable for exterior use unless air infiltration is acceptable or there is no risk of water infiltration. Surface mounted sweeps under or on the face of the door can be field applied by installer to reduce the gap under the doors, however, such sweeps are not effective for weather sealing. Also, refer to the LaCantina Doors zero step sill for an improved option for flush floor applications.
